

Green-IT; ROI in just 4 weeks

German University rolls out “Auto Shutdown Manager” to save money and help the environment

Following considerable investigation into sustainability issues and environmental protection, the University of Applied Sciences in Osnabrück, Germany, took a major environmentally-friendly step in April 2009.

After a trial period in April, the University started to roll-out the Green-IT Solution “Auto Shutdown Manager” from EnviProt across more than 120 computers.

“It was very important for us to do something” said Mr. Dieter Schweiger, System Administrator of the IT Department. “Our key reasons were: To save energy - this is an active way to protect the environment; it preserves our scarce resources; and, of course, to save money.” He continued, “We decided on EnviProt’s Auto Shutdown Manager Solution because it was stable from day one and it requires very little administration. We’ll achieve a complete return on our investment in around 4 weeks!”

Auto Shutdown Manager is a Windows Service-based, centrally managed and network enabled Power Management tool for enterprises, schools, universities and private users which helps to save money and increase security.

It provides timed shutdown facilities - which can depend on many factors such as CPU or network load; week, day and time; idle analysis; backup processes and much more.

EnviProt is currently running a special, limited time offer uniquely for Schools and Universities. Schools can purchase a site-wide licence, regardless of the number of PCs installed, for just \$119 USD yearly - or \$499 USD for a lifetime licence.
